

Method Details

Dense RADIO reconstruction, sparse primitive anchoring, and support calibration train the same compact memory.

(a) Multiview Primitive Registration

Training only: multiview evidence is distilled into compact codes; no VPR cache is read at inference.

(b) RADIO Feature Reconstruction

A low-dimensional memory reconstructs RADIO features; adaptors only constrain or probe usability.

(c) Support-Calibrated Selection

The calibration acts on support, not just feature cosine, reducing fragmented or low-visibility selections.
